

DCM demo

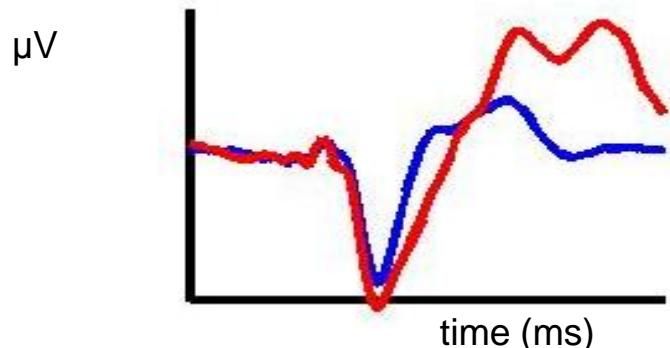

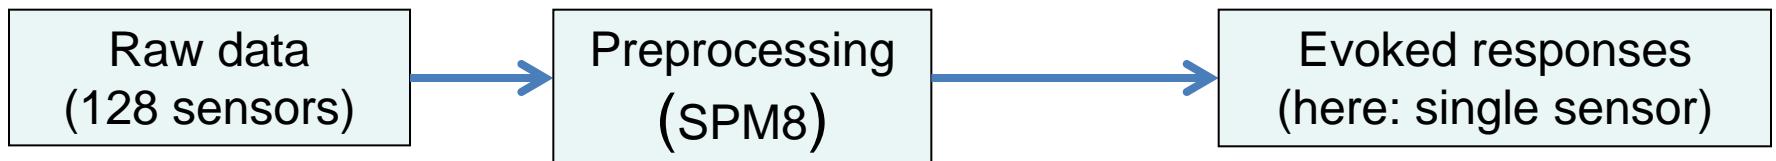

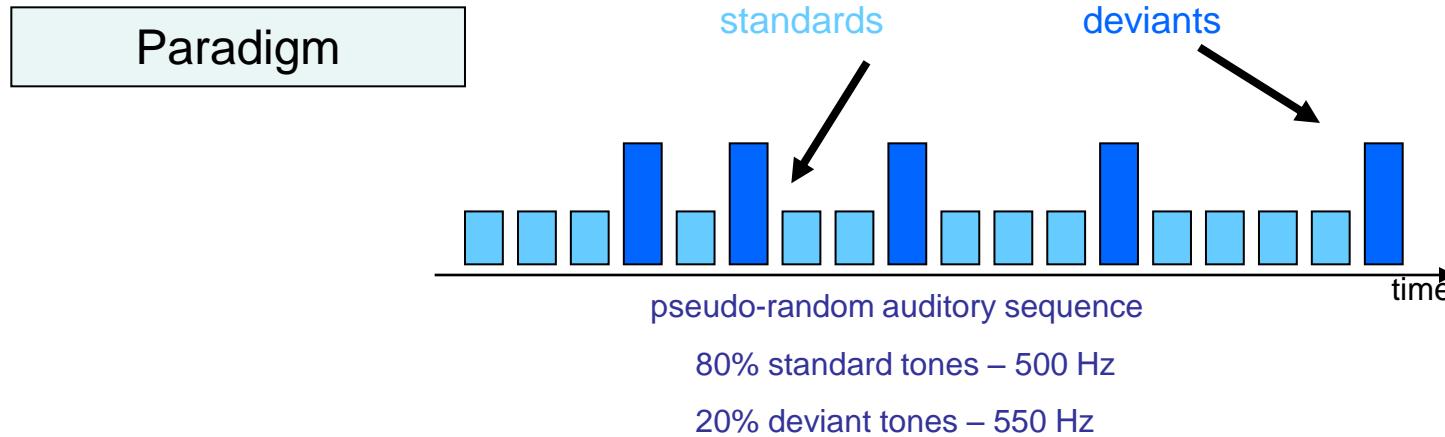

André Marreiros

Wellcome Trust Centre for Neuroimaging

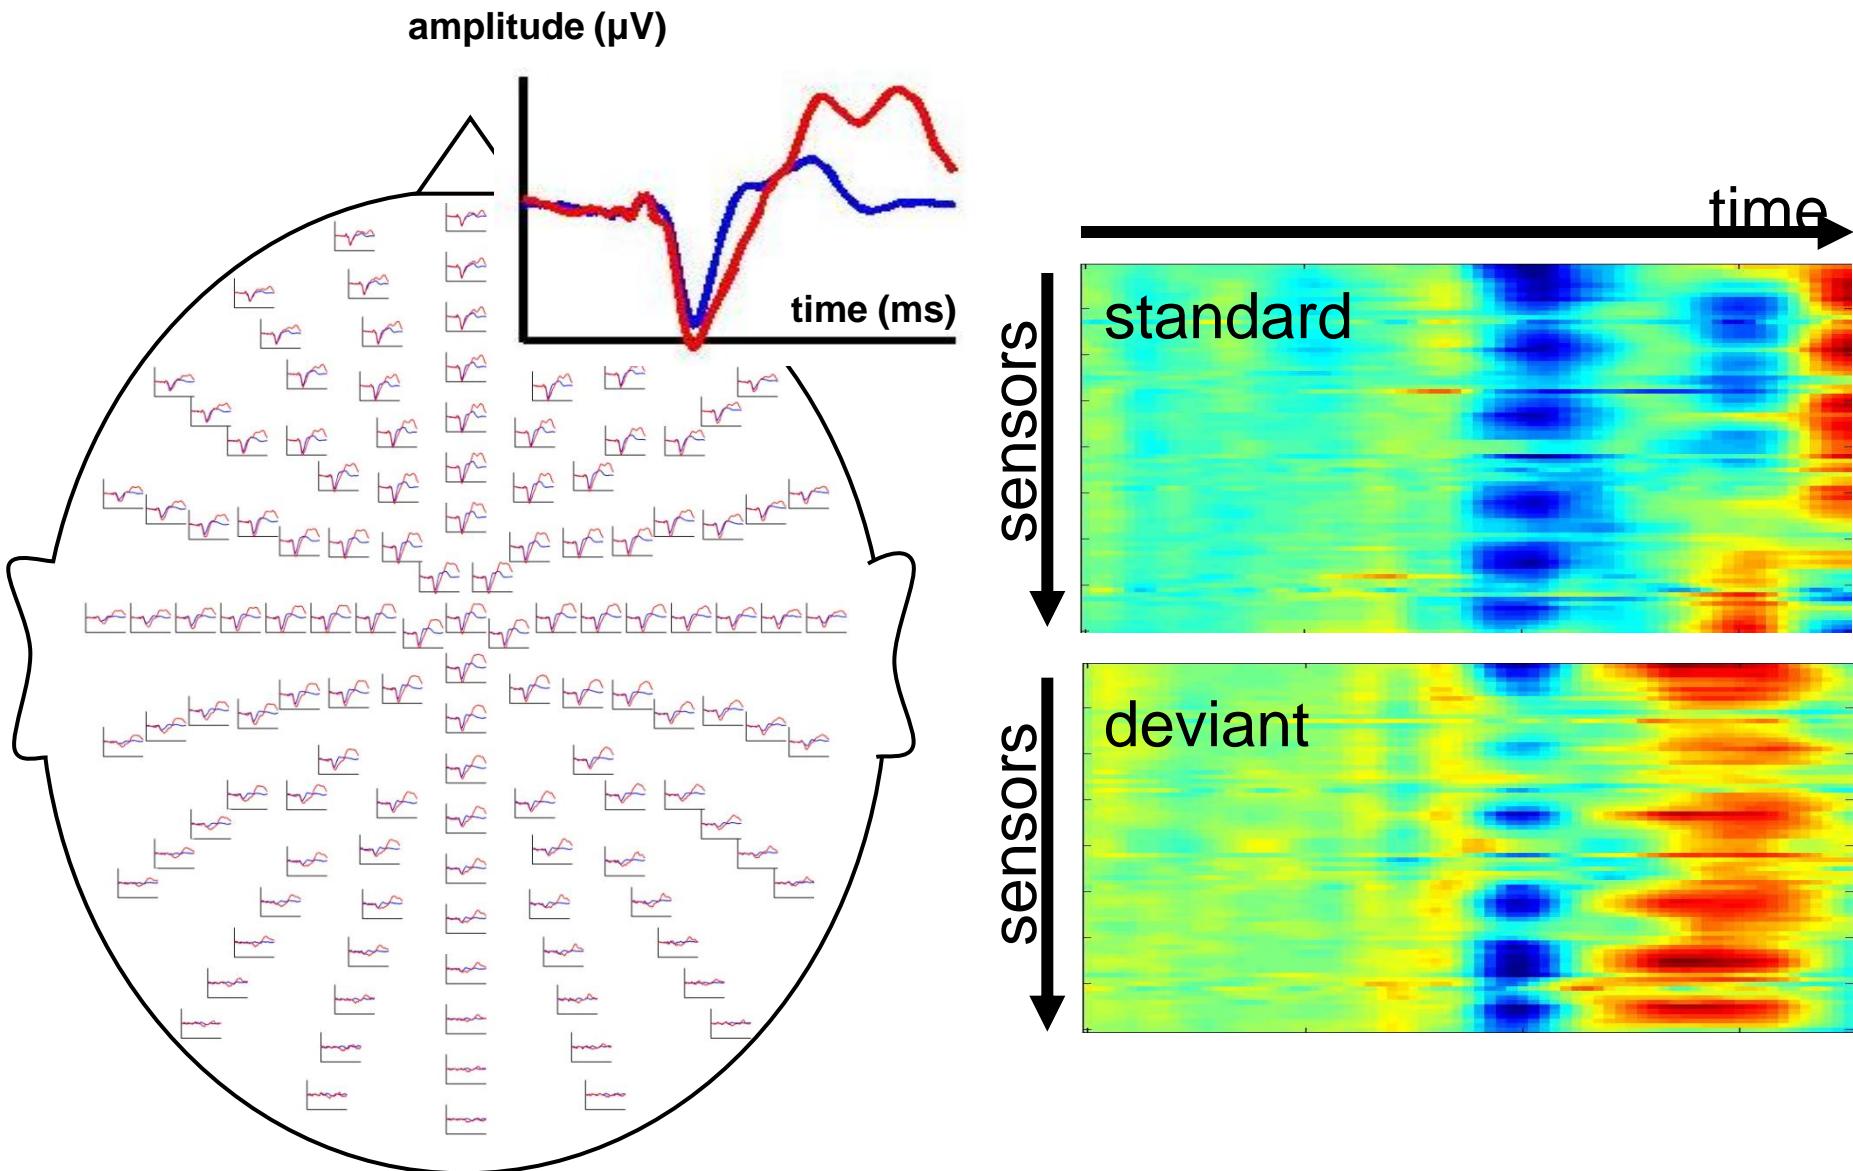

Mismatch negativity (MMN) – DCM Motivation

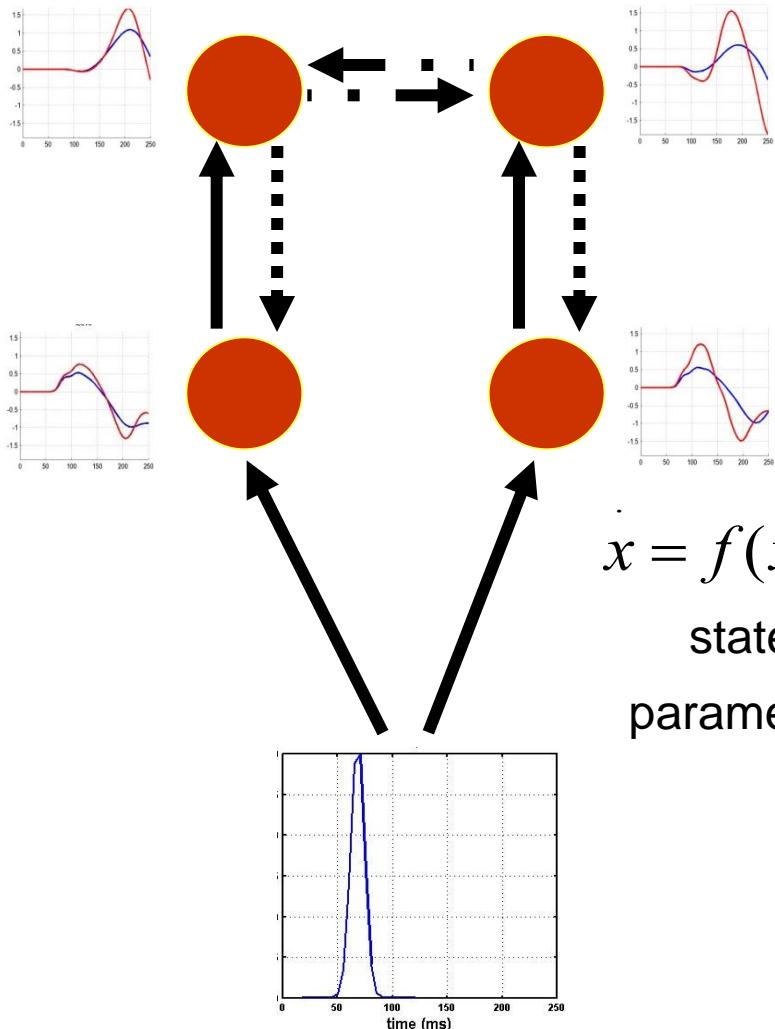

Garrido et al., (2007), *NeuroImage*

Electroencephalography (EEG)

The generative model

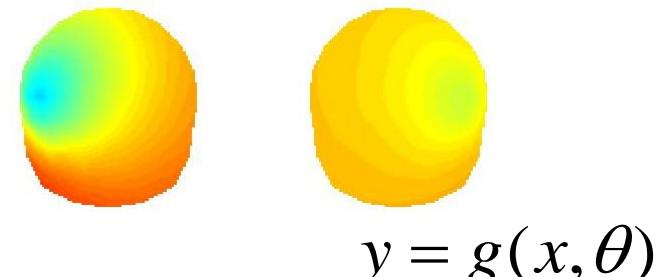

Source dynamics f

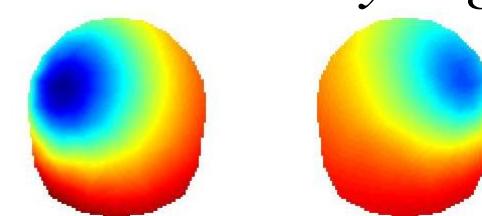

$$x = f(x, u, \theta)$$

states x
parameters θ

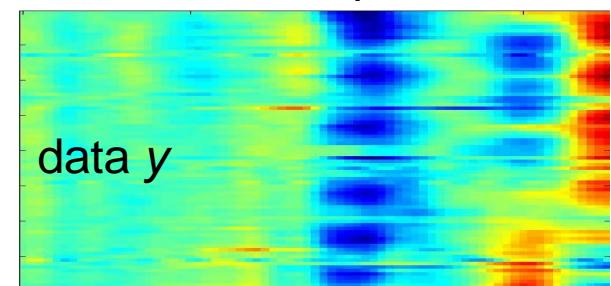

Spatial forward model g

$$y = g(x, \theta)$$

Evoked response

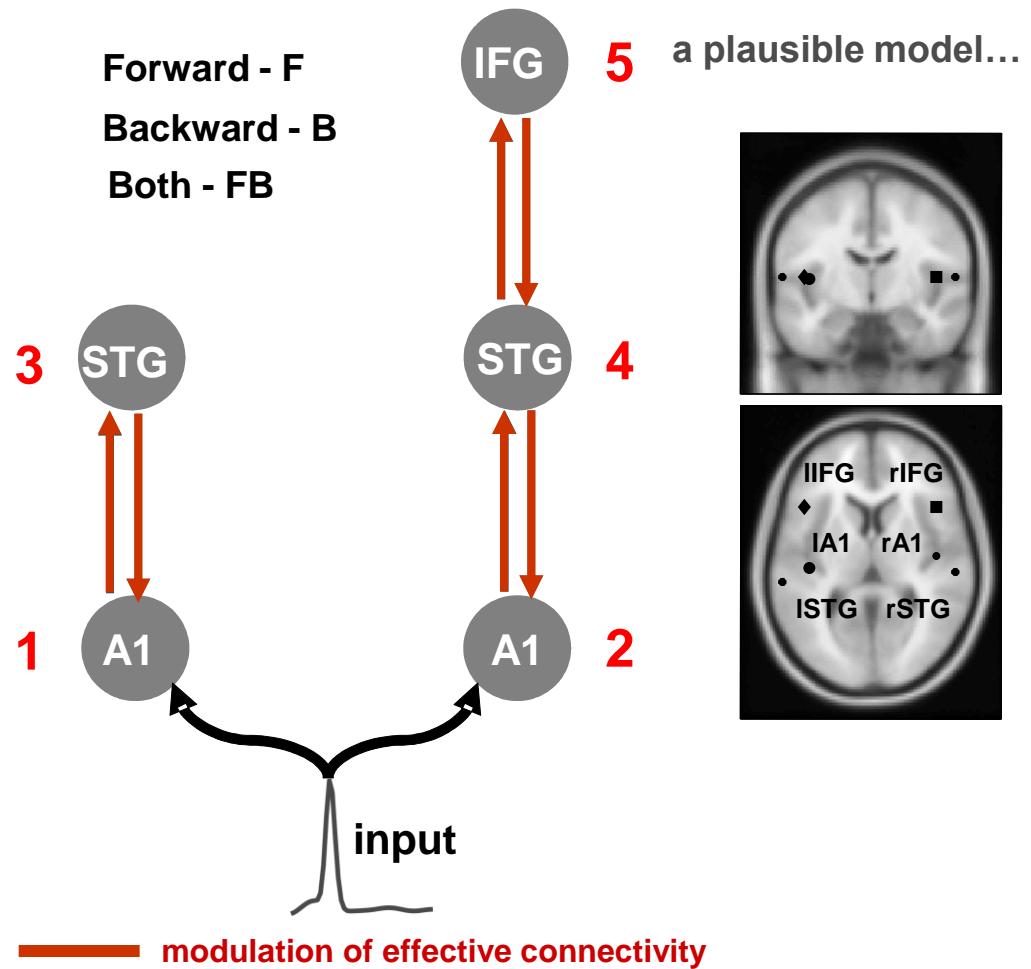

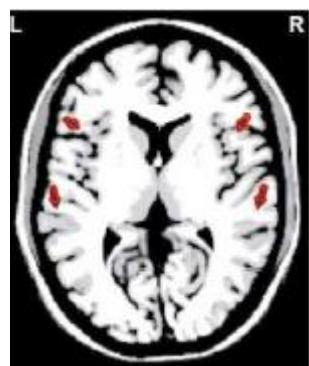

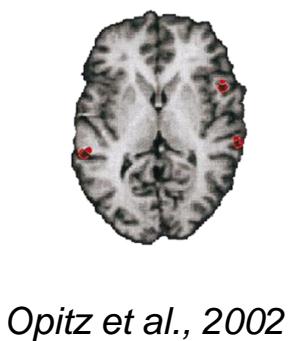

data y

Input u

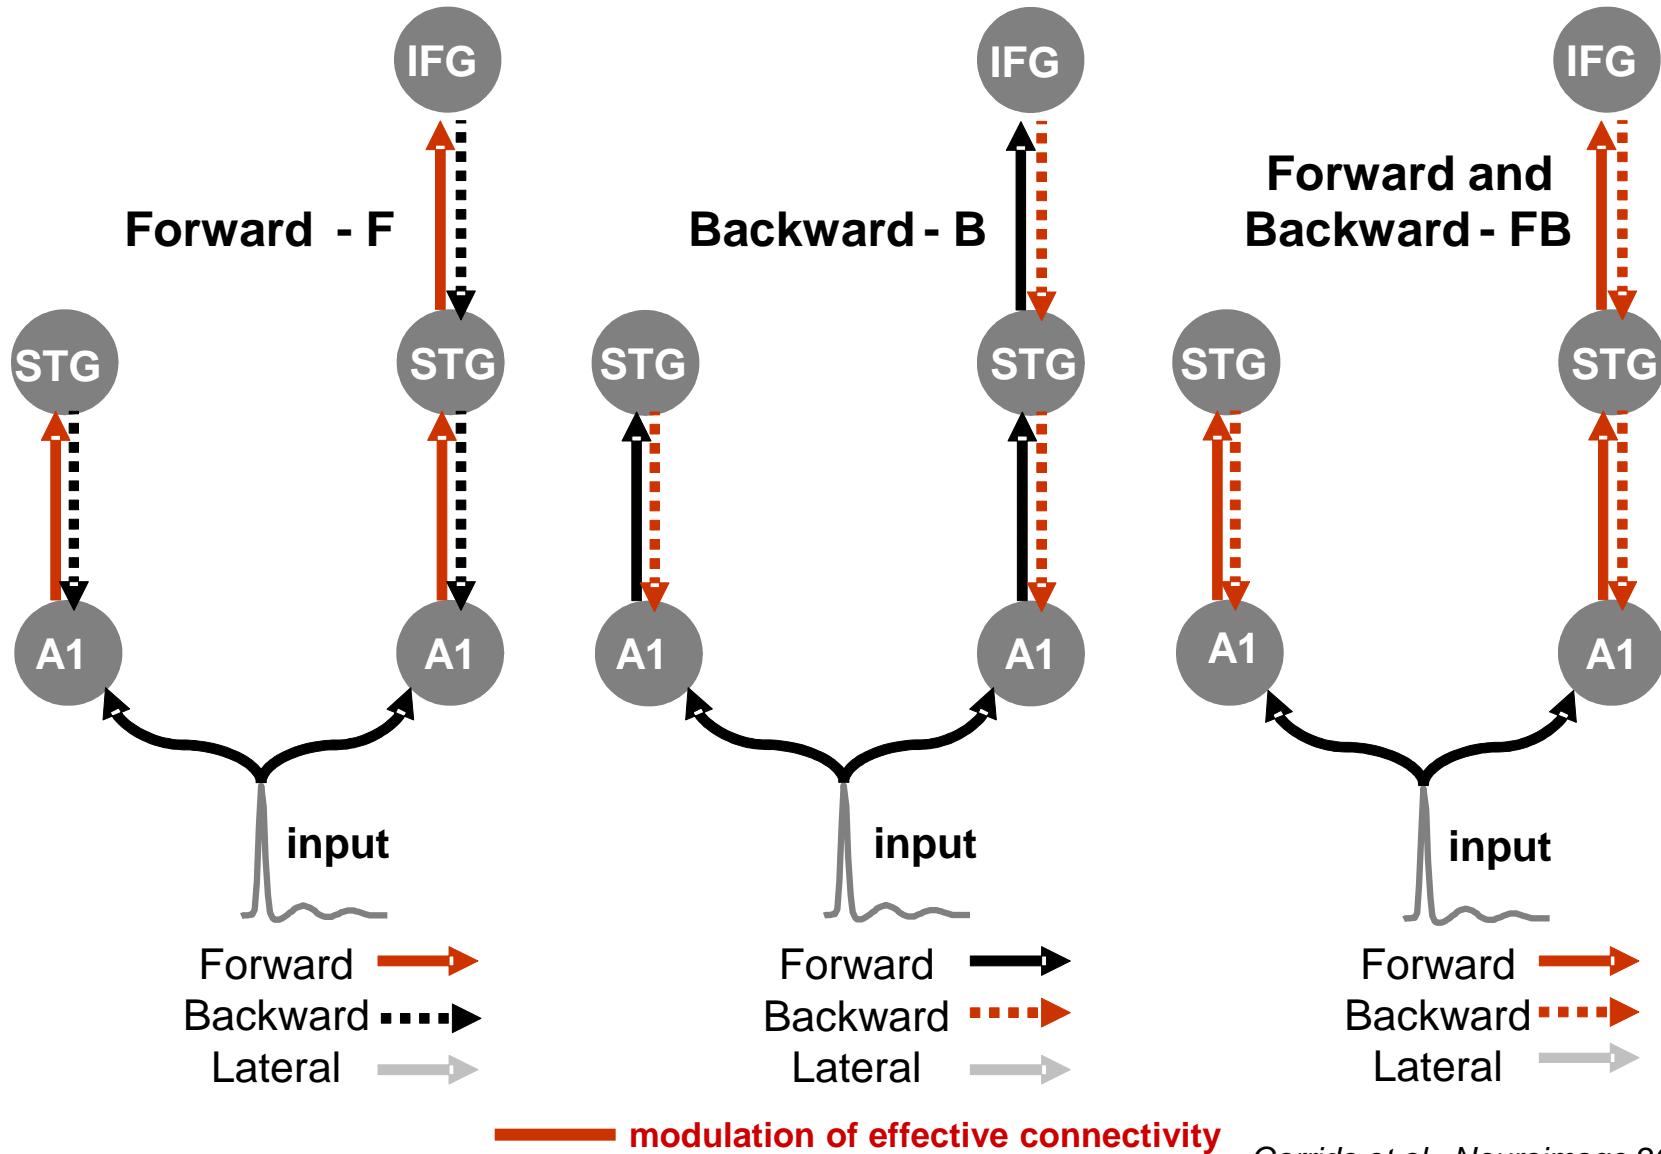

David et al., Neuroimage 2006; Kiebel et al., Neuroimage 2006

DCM specification

Hypothesis-testing for the mechanisms that caused the data

DCM specification – testing different models/hypotheses

Analysis steps

1. Preprocessing and SVD decomposition
2. Model specification: guessing cortical areas and connections
3. Model inversion: finding the parameters that minimize differences between observed measurements and model predictions
4. Bayesian model comparison and statistical inferences on parameters from the best model
